

SIES – End-to-End Testing Checklist

Safiyan International ECommerce System

Tester Name:

Date:

Environment: Local Dev (localhost:5173)

Build/Commit:

How to use this sheet: run through each section top to bottom on a fresh browser session (clear localStorage between role switches). Tick each box as it passes. If something fails, write a short note under that item and log it as a bug.

0. Pre-Test Setup

- Backend API is running (dotnet run on Safiyan.Api) with no startup errors in the console
- Frontend dev server is running: **npm run dev** shows Local: http://localhost:5173/
- Database is reachable; connection string in appsettings.Development.json is correct
- Demo seed users exist with correct roles: admin@sies.local (Admin), vendor@sies.local (Vendor), customer@sies.local (Customer) — verify with: `SELECT Email, Role FROM Users`
- Browser cache/localStorage cleared before starting (Application tab → Local Storage → clear)

1. Authentication & Login

- Visiting `/login` shows the login card standalone — no Navbar/Sidebar/Footer around it
- Three demo role buttons (Admin / Vendor / Customer) are visible (dev mode only)
- Clicking each role button auto-fills the correct demo email/password
- Submitting the form with each role logs in successfully and redirects correctly: Admin → `/admin`, Vendor → `/vendor`, Customer → `/home`
- Submitting with a wrong password shows a clear error message, no crash
- Visiting `/register` also renders standalone (no sidebar/header)
- Registering a new customer account works and logs the user in
- Logout button clears the session and redirects to `/login` (localStorage keys removed)
- Visiting a protected route (e.g. `/cart`) while logged out redirects to `/login`

2. Customer Journey

Browsing

- Home/Store page loads with product highlights and no console errors
- Product listing page shows products with images, price, name
- Category filter and search return correct, relevant results
- Product Details page shows correct price, description, stock, images

Cart

- Add to Cart works from both the listing page and the details page
- Cart page shows correct items, quantities and subtotal
- Changing quantity updates the line total and cart total correctly
- Removing an item updates the cart immediately
- Cart persists correctly per logged-in user (not mixed between accounts)

Checkout & Orders

- Checkout form validates required fields (address, phone, etc.)
- Selected payment method (e.g. Cash on Delivery / gateway) is honoured on submit
- Placing an order clears the cart and shows an order confirmation
- New order appears in Order History with correct items and total
- Order Tracking page shows a sensible status (Pending/Processing/Shipped/Delivered)

Wishlist & Profile

- Add/remove product to Wishlist works and persists after refresh
- Profile page loads current user info and saves edits correctly

3. Vendor Panel

- Logging in as Vendor shows only the Vendor sidebar menu (Vendor Dashboard, Products, Orders)
- Vendor Dashboard shows a sensible summary (own products/orders only, not other vendors')
- Vendor can Add / Edit / Delete their own products
- Vendor cannot see or edit another vendor's products (permission check)
- Vendor Orders lists only orders containing this vendor's products
- Vendor can update an order's status and the change reflects on the customer's tracking page

4. Admin Panel

- Logging in as Admin shows the full Admin sidebar (Dashboard, Products, Categories, Orders, Customers, Vendors, Coupons, Reports, Accounts, Roles, Settings)
- Admin Dashboard shows correct overall totals (orders, revenue, users, etc.)
- Product Manage: Admin can Add/Edit/Delete any vendor's product
- Product Manage: PDF export produces a correctly formatted file
- Product Manage: Excel export produces a correctly formatted file with matching data
- Category Manage: Add/Edit/Delete categories works and reflects immediately in the storefront
- Order Manage: Admin can view every order and manually change its status
- Customer Manage: Admin can view/deactivate a customer account
- Vendor Manage: Admin can approve/block a vendor account
- Coupon Manage: creating a coupon and applying it at checkout correctly discounts the total
- Reports: sales/revenue figures match the actual orders placed during testing
- Accounts: payment/accounts report loads without errors
- Role Management: changing a user's role updates their access immediately after re-login
- Settings: changes save and persist after a page refresh

5. Role-Based Access & UI Consistency

- Admin sidebar never shows Vendor-only or Customer-only menu items
- Vendor sidebar never shows Admin-only menu items
- Customer sidebar never shows Admin/Vendor menu items
- All text is clearly readable against the dark theme (no light-on-light or dark-on-dark text)
- Buttons on the Home page (Login / Register / Admin Panel) are all clearly visible

- Layout is usable on a narrow/mobile width (sidebar collapses or scrolls sensibly)
- Navbar shows the correct link per role (Dashboard for Admin/Vendor, Store for Customer)

6. Regression Checks (Previously Fixed Issues)

- Login/Register pages still render standalone, without sidebar/header wrapping them
- Demo users still have correct roles in the database (Admin/Vendor/Customer, not all 'Vendor')
- Home page's Register and Admin Panel buttons are still clearly visible against the dark background

These three were bugs found and fixed during development — re-check them after any routing, seed-data, or global CSS change.

7. Sign-off

Section	Pass / Fail	Notes
0. Pre-Test Setup		
1. Authentication		
2. Customer Journey		
3. Vendor Panel		
4. Admin Panel		
5. Role-Based Access & UI		
6. Regression Checks
